

eXtra4<winIII> Software for Label Printing

Industry-specific labelling for jewellery and watches

Get started immediately with label printing – without time-consuming label design.

That quickly you get to the ready-printed label: Simply type in data into a ready-to-use label layout and print it. You choose the design you want instead of having to create it yourself. No need to define input fields, font sizes, line spacing and barcode parameters! More than 1,000 different layouts are provided in the software for over 400 label shapes. The label design has already been done for you by eXtra4<winIII>.

- Ready-made label designs for maximum data volume with optimum readability
- Automated generation of barcode and matrix code
- Integrated database for item and address management
- Printing of single labels without label loss by printer's feed after each print job
- Help function with step-by-step instructions
- Start-up assistance included via online support for all editions subject to a charge
- Approved since 20 years in jewellery and watch industry
- Several thousand highly satisfied users worldwide

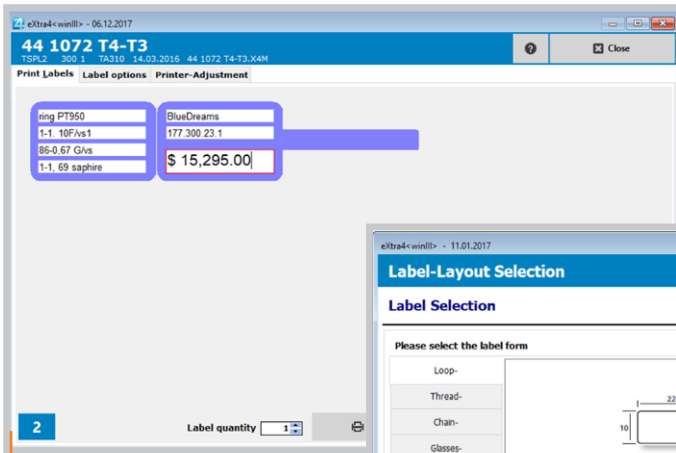

Due to the general cost situation, we can no more keep our prices constant over a longer period of time, but have to permanently adjust them to the supply market. Please find up-to-date prices in our online shop.

eXtra4<winIII> The software core function: label printing

Label printing is the key function of eXtra4<winIII>. All seven software editions fulfil this task and deliver label printing of the same high quality. The only differences are in the scope of services. The ease of use, on the other hand, is the same across all editions. These features support the user in label printing:

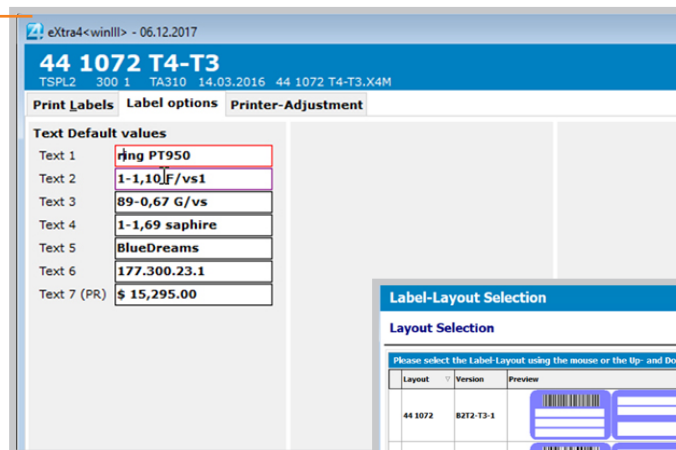

Type'n Print – Straight to print
The ready-to-use label designs are activated as a layout for the desired label shape. They contain the entry fields where a user enters the data to be printed on the label.

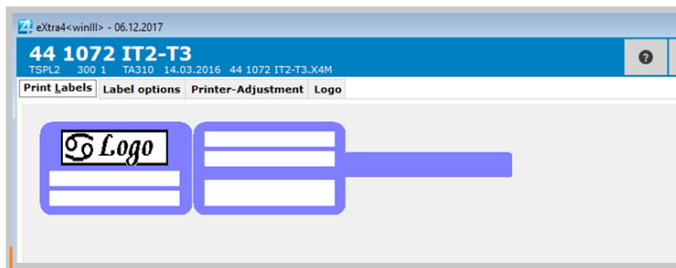

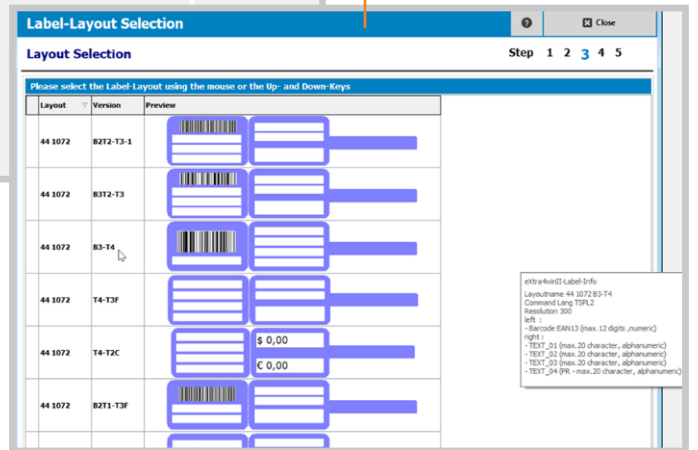

The Label/Layout Assistan
Precision is guaranteed when printing labels with eXtra4<winIII> without users having to do anything themselves. The basis for this are predefined label designs. When selecting them, the label/layout assistant ensures that only designs are suggested to the user that fit the desired label and can be processed by the stored printer model.

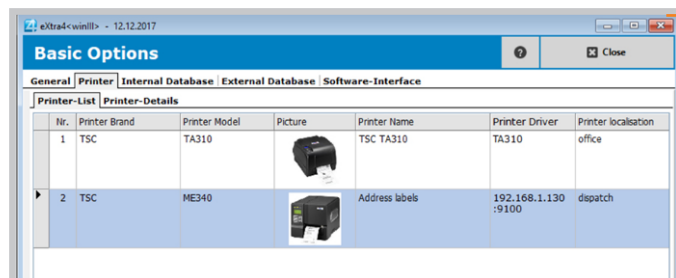

Predefined text as label content
Filling entry fields without typing can be done with text presets. As soon as the label layout is called up for data entry, the entry mask appears with already filled in entry fields. The stored text only needs to be corrected in details, e.g. data for weight and height.

Barcode generation
eXtra4<winIII> creates a barcode or matrix code from an item number and controls its printing. Into what code an item number is converted by the software depends on its structure and the selected label layout.

Logo printing
Users can add their own company logo to labels. The software copies the signet as a bitmap graphic into the data entry mask and transfers it permanently to the printer memory. There it is ready for printing on the label when data is printed out.

Printer management
The software carefully guides users when they connect their devices to eXtra4<winIII>. A table clearly lists all connected label printers and is the basis for subsequent printing processes.

eXtra4<winIII> Additional functions beyond label printing

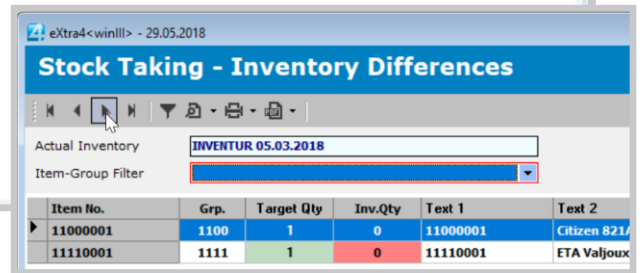

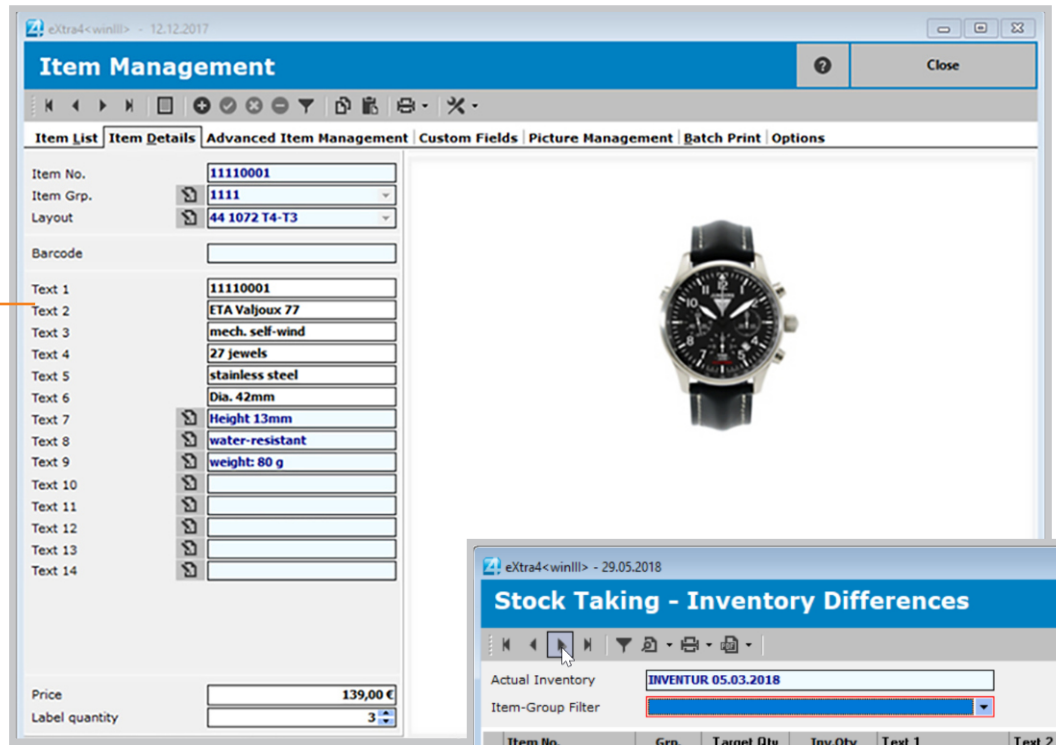

The eXtra4<winIII> software has a modular design. In addition to label printing as its core, it has numerous additional functions. They are graded according to need and are available in software editions that build on one another.

Item management

Instead of entering data for the label of an item again and again, the item with all its characteristics is created as a data record in the database integrated in the software. Details for label printing can now be read out there again and again. The item number serves as a search key. It can be generated automatically by eXtra4<winIII> via item groups.

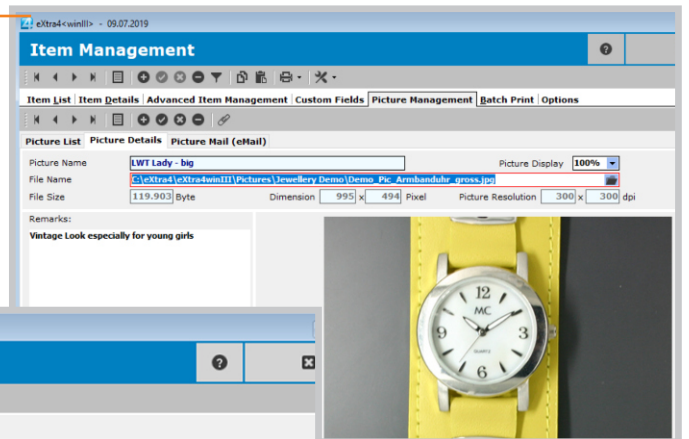

In Edition "Basic", there is space in memo texts for item data beyond the information for the label. A small product image (thumb-nail) can also be stored.

From "Advanced" edition onwards, eXtra4<winIII> supplements the item management with stock levels and storage locations. Barcode can be used to control goods movements. The software enables an evaluation of master data via lists, their printing via a report generator and an inventory.

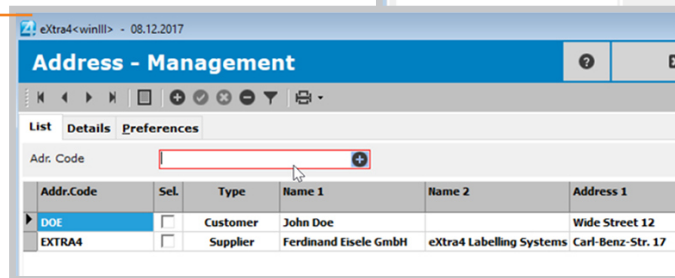

Picture management

For the management of an image pool, eXtra4<winIII> links items with an unlimited number of image files in high resolution of current cameras. This makes it easier to search for and combine a selection of images and to send them via address management data.

Address management

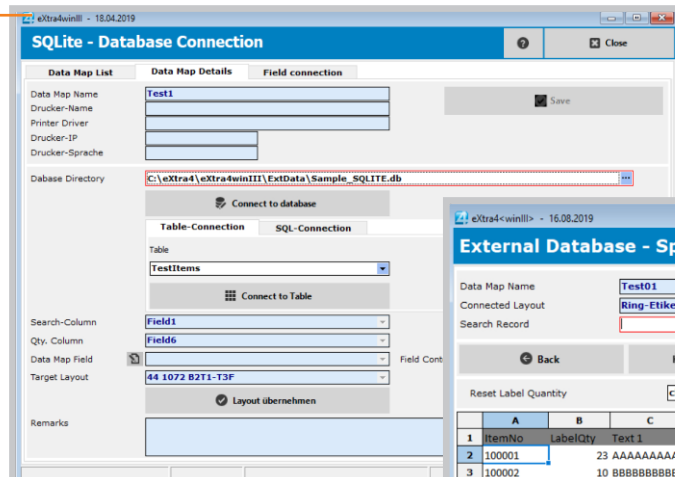

For printing dispatch labels, eXtra4<winIII> manages addresses under a unique code, e.g. the customer or supplier number. Categorisation allows the data to be sorted according to suppliers, customers and other criteria.

Integrated database

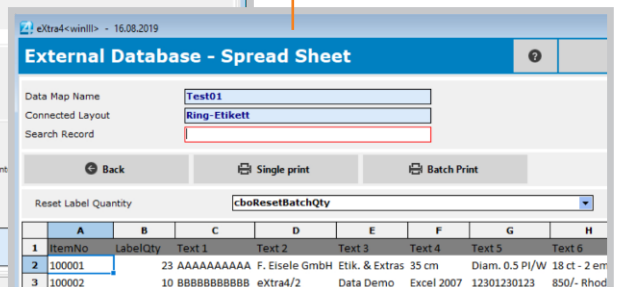

Depending on the edition, the database is designed locally as a single-user solution or as a server for a multi-user solution.

The software eXtra4<winIII> is able to access many third-party databases directly. In this case, data transfer via export/import is not necessary for label printing.

Data export in Excel format

The software delivers selected data in an .xls file or .xlsx file, where they can be conveniently edited and compiled into lists.

As software for label printing, eXtra4<winIII> is optimally tailored to labels and hardware from eXtra4 Labelling Systems. The expertise of Ferdinand Eisele GmbH as a label manufacturer and dealer/distributor of suitable thermal transfer printers and identification code scanners ideally complements the experience of eXtra4 Software + Service GmbH from over 25 years of software development.

The eXtra4 brand combines industry expertise with technical know-how and provides labelling systems for jewellery and watches. Jewellers and goldsmiths, manufacturers and retailers alike will find industry solutions from a single source that are specially designed to meet their individual needs.
